

Concerto

Concerto is a module that has been developed to manage multiple 'managed' databases via a 'master' database. This is especially interesting if you want to implement standardizations in the practices that your organization manages.

It is currently possible to organize products, actions, protocols, templates and care plans in the 'managed' databases from the 'master' database. In concrete terms, this means that you can look up, modify and create those items. Afterwards you can synchronize them (completely or partially) to the database(s) of your choice.

Concerto also always saves the context and the edits of the items, so you will be able to look up everything afterwards via analyzes and reports.
